

Quick Guide to Filter Classes

Type	Title	Description
	'L' Class Dust (Low hazard dust)	This filters 99% of all dust that is extracted. The air that is exhausted only contains dust particles of less than 1mg.
	'M' Class Dust (Medium hazard dust)	This filters 99.95% of all dust that is extracted. This means that the air that is exhausted has particles of dust less than 0.1mg still in it.
	'H' Class Dust (High hazard dust)	This filters 99.997% of all dust that is extracted . This filters out more of the finer dust particles that can be harmful. (MDF & Asbestos dust require H Class extractors due to the fine dust that is present when dealing with them).
